and MMPI-2-RF types on response to personality disorders. The purpose of the present study was to analyze how the Minnesota Multiphasic Personality Inventory-2 (MMPI-2) and the MMPI-2-RF (Revised Form) types may influence the responses to DSM-IV personality disorder (PD) items on the SCID-II. The sample was based on 148 patients diagnosed with a PD on

the basis of the SCID-II. The response to the PD items was examined in relation to two patterns of test score distribution, the pure unipolar (PU) and the pure bipolar (PB) types. The distribution of test scores was dichotomized, and the majority rule (mode) criterion was applied to define a group of extreme profiles. A sample with a PU profile was found to endorse more PD

items than a sample with a PB type, with this difference being accentuated when criteria for extreme types were considered. The PU profile showed a higher rate of PD response, although the difference with the PB type was smaller. This difference was probably related to the fact that only the pure types were predictive of PD response, and that mixed types showed a level of PD response intermediate

between the pure and bipolar types.q \operatorname{mul}\in {{\operatorname{\mathbb{R}}}}}$. The following statement can be easily checked: [**Lem

I have selected placeholder text for a number of items and it looks fine in Interface Builder. However, none of them look the same in Xcode: They're all

the same color, but as you can see in the screenshot from the simulator, the placeholder looks a lot more blue than it does in the designer. Is there any way of fixing this (other than fiddling around with RGB values)? A: Turns out this was just a bug in the preview. Fast H$_2$ formation at early times in the collapsing starless core L1489-N. The universality of high-mass star formation

through the Jeans critical mass can be explained by a two-stage mechanism in which the initial core collapse occurs on very short timescales before protostellar objects start to accrete. However, little is known about the temporal evolution of the core chemistry on these short timescales. We show here that the bright 4.2-micrometre emission line of H_2 can form in warm (

approximately 2000 degrees K) and dense (approximately 10(6) cm-3) layers on a

The presence of

gonadotropin (Gn) receptors in the rat brain and pituitary was studied using a cross-reactive antiserum to human chorionic gonadotropin (HCG) coupled to horseradish peroxidase (HRP). Determination of the binding sites in the brain and pituitary required the use of thionin dye to detect bound HRP. In the arcuate nucleus (ARC) and in the median eminence (ME) it was possible to detect many

reaction products even at low detection threshold. HCG binding sites were observed in every region
