Lipid lowering agents block the synthesis and/or degradation of cholesterol. These drugs lower cholesterol mainly by their effect on the absorption of cholesterol from the small intestine. They can be taken orally as single agents or in combination. They can have either positive or negative effects on serum triglycerides. Therefore, their use has to be closely followed by a physician. More than 10 new hypolipidemic agents have become available in recent years. Their purpose is to reduce the risk of atherosclerotic disease in hypercholesterolemic patients. This review presents the basic pharmacologic properties, clinical use, safety and costs of the new lipid lowering agents.Eric Christian Olsen Eric Christian Olsen is an American historian, and Professor of History at Barnard College and Columbia University.
