Projections of the cytological effects of fluorozirconate treatment on soil-dwelling anaerobic ciliate *caldalkalibacillus xylanolyticus*. Fluorozirconate (FZR) is an organic fluorine compound that has been used to control soil-dwelling anaerobic ciliates (AChls). We examined the ability of FZR to inhibit the growth of the soil-dwelling anaerobic ciliate *caldalkalibacillus xylanolyticus*. The FZR concentration required to inhibit the growth of this microorganism was estimated to be 5 mg FZR/L. In the presence of 5 mg FZR/L, ciliate cell viability decreased, and the ultrastructure of the cells was affected.

We then examined the effects of the low-concentration FZR treatment on the community structure of the soil microbial community in a field experiment. The FZR treatment decreased the soil organic matter content and the soil's invertase and acid phosphatase activities, suggesting that the FZR treatment can influence soil enzyme activities in low concentrations. The Bacteria/Archaea division ratio in the soil was also changed by FZR treatment. This study showed that FZR treatment affects soil enzyme activities and ciliate cell viability; however, the direct effect of FZR on the microbial community remains to be clarified in future studies. Small talk RATE THIS | Share this: Small talk is that which we have for “small”. It’s that “small” that’s the problem with small talk. Only when we’re really comfortable and relaxed do we enjoy small talk. But you have to be prepared to engage in it, and it’s rude to be unprepared or not interested. Small talk requires interest. If you really don’t care about what the person is saying, they may start to feel like they’re talking to a wall. And we, as adults, can’t always control our interest levels. And small talk is not always about getting to know a person better. Sometimes it’s just in passing. You
