As Michael Cohen prepares to testify before the House Oversight Committee next week, he'll be facing congressional investigators probing President Donald Trump and his former personal attorney. But to the bank account of his father, Lanny, Cohen's appearance is just one more name in the lineup, which also includes the Chairman of the Federal Reserve. Lanny Cohen's firm, Lanny Cohen & Associates, does business with a handful of federal government agencies. The firm boasts that its clients include the Central Intelligence Agency, the Department of Defense, the Justice Department, the Department of Homeland Security and the Securities and Exchange Commission. Cohen's work included representing big banks such as Citibank and Goldman Sachs. The Intelligence Community Inspector General was one of the rare exceptions. It has not paid Cohen's firm a dime, according to LinkedIn. But in its application to the CIA, a co-worker of Lanny Cohen's named Jay Love — who works on international investigations — lists in the "External Resources" section a variety of payments to the firm. Those include: \$10,500 to Lanny Cohen & Associates in 2016. \$20,000 to Lanny Cohen & Associates in 2015. \$3,500 to Lanny Cohen & Associates in 2013. \$45,000 to Lanny Cohen & Associates in 2011. Lanny Cohen was a top producer at the ICIG. He spent more than a year working in counterintelligence in 2009, the same year he entered the Trump Organization. Q: Understanding BFS Using Heap and Queue I am attempting to learn data structures and am reading Understanding Data Structures using Queue, Stack, and Heap by Jon Kleinberg. In section 2.5, the author defines the BFS algorithm using an implementation using a heap. In the recursive implementation, the author stores nodes in a queue instead of the heap. I am trying to understand why the implementation using a queue works as well as why there was the need to use a queue if we are using a heap to implement BFS. A: The best way to understand how to implement algorithms efficiently is to write them from scratch, by hand (i.e. literally implement it by hand). Your question (which is also essentially a possible homework question) indicates a lack of understanding of how a heap works and what advantage it has over a queue. Heap allows for efficiently insert and delete items, queue cannot. If you understand that the heap need to maintain order for the items when inserting/deleting then you will understand why the queue is a viable option. "How do you know it's not me?" "C'mon, babe, tell me!" "Dude, I said not in my car, goddammit!" "Oh, please!" "Give me my wallet!" "They're not listening." "Oh, 3da54e8ca3
