Creating a Vector Image (Saving Vector Files)

1. You can choose any type of logo or illustration for the client you're working on. The drawing may be simple or complex, but it needs to be scalable because you will need to incorporate it into various sizes of business cards, postcards, brochures, and flyers.
2. On the Home tab's Customize subtab, click the heading above the Layers panel to open the Layers panel. This panel lists all the layers in your document.
3. Click the background layer that contains your image to select it.
4. Click the Image Trace button on the Tools panel or press CTRL+T (Windows) or CMD+T (Mac) to open the Trace section of the Options bar and select Vector Trace from the drop-down menu. This process makes the image into a vector file. You can still modify the image's colors, but you can't change the image's resolution or alter the shape with the Pen tool because vector files don't have pixel resolution.
5. Return to the Layers panel. Open the Layer Style menu and click the Stroke Color button (if the Layer Styles dialog box appears, click the green OK button to exit the dialog box) or click the Stroke Color icon (red circle with a green arrow pointing toward the bottom-right corner of the dialog box) on the Stroke Color menu, as shown in the figure below. This brings up the Color panel,

The Rubber Stamp tool allows you to apply a preset or a custom graphic of your choice directly to the image. Some of the effects and tools in Photoshop are present in both the Adobe Bridge application (on the application's menu) and Photoshop. We've listed a few of them for each. Adobe Bridge has plenty of pre-made tools and effects, including ones such as the Auto Levels tool, Color Curves and the Adjustment Panel. If your image does not have the right color cast, check the cast tool to adjust the image. Photoshop The Photoshop application has its own tools and effects, including the Pen tool, Screen Clipping, the Liquify filter, the Pathfinder tool, the Color Replacement tool and the Gradient tool. Creating Custom Brushes Creating customized brushes for Photoshop can be daunting because of the amount of information you have to consider. Photoshop has a large selection of brushes and brushes can have many different attributes. The most common brush attributes are: Shape - The brush shape. Custom brushes in Photoshop can have any shape or path that you want, from basic shapes to more complex ones. Size - The brush's size, which is an accurate representation of the size of the brush stroke. It is measured in pixels. Angle - The direction of the brush stroke. Photoshop has many different angle options. Flow - The direction and speed of the brush stroke. There are many possible combinations of these attributes. Before you start drawing your custom brush, you should first consider: How many brush controls do you need? The normal approach to creating custom brushes is to start with the first brush control. In a typical brush, there are three controls: the Shape and Size. If you decide to add a fourth control, you will need to draw the control directly on the Photoshop canvas, because you can't have a brush control that is not visible. You should keep in mind that Photoshop allows for you to have many different types of brushes and the total number will be limited only by your patience, skill and the size of your original brush. The Shape control determines the brush tip, which is usually a simple shape. You can use closed paths (made up of straight and curved lines), bezier curves and polygons (a set of several smaller, connected lines). You can use simple shapes, like squares, rectangles and triangles, or complex shapes, like hearts and polyhedrons

Q: Get the name of an XML element in C# I need to get the name of an XML element in C#. I've read this thread, but still can't find an answer for my case. I've got this: I want to get only the Model name, because after that I need to iterate through Models. How can I do that? A: You can use the XElement.Name property. A: If you are in a loop then you need to get the current element and check to see if it is the one you want. If not, just move to the next element. foreach (XElement element in xmlDoc.Descendants("Model")) { if (element.Name == "name") { //name found! do stuff } } UPDATE: Start with the current element var element = element.Element("Model"); Check to see if it is the one you want if (element.Name == "name") { //name found! do stuff } EDIT: You need to look for element as if you would in a for loop. var element = xmlDoc.Descendants("Model").FirstOrDefault(); if (element != null) { if (element.Name == "name") { //name found
