Today, AutoCAD is the world's leading 2D drafting and design software. It remains the standard for engineering design and 2D drafting software, with over 90 million licenses sold and more than 130 million hours of usage annually. History of AutoCAD AutoCAD was introduced in 1982 by Autodesk Inc. as a desktop app for use on personal computers. Later that year, the first version of AutoCAD was released for use with the Intel 8080/Zilog Z80 microprocessor, and the name AutoCAD was applied to the software. The Intel 8080/Z80 is a 4-bit microprocessor used in home computers, such as the Apple II, the Atari, the BBC Micro, and the IBM PC. Most CAD programs at that time were designed to work on a mainframe computer. CAD operators at separate terminals would work together to plot or modify a drawing. Sometimes a local "server" was connected to a mainframe and a group of terminals. A CAD operator would connect his terminal to the server and then draw on a drawing. In 1982, a user of the software could connect a personal computer, such as a Radio Shack TRS-80, to a graphics terminal and draw on a paper copy of the drawing. Then the drawing could be transmitted via telephone lines or networked to another terminal and further modified there. Drawing files were ASCII text files. AutoCAD continued to be developed throughout the 1980s and early 1990s, and by the early 1990s, the first portable AutoCAD programs were available. AutoCAD was introduced as a MS-DOS program and ran on Microsoft Windows. The first portable AutoCAD was released in 1989, and AutoCAD W was the first 3D portable CAD application. AutoCAD was released as a WebCAD application in 1998, and was the first desktop CAD app to run on the Internet. AutoCAD became the first desktop CAD app to run on Mac OS X and Linux in 2004, and AutoCAD became available as a mobile app in 2007. AutoCAD was released as a web app in 2017. Since the introduction of AutoCAD, the cost of the software has decreased and the features and functionality of the software has increased. Initially, the cost of licensing AutoCAD was in the thousands of dollars. In 1982, for example, it cost a company \$25,000 for the first year, and \$2,000

Customization It is possible to customize Autodesk's drawing applications by creating macros, plugins, and templates. These are either static or Dynamic, which means that they can be run, saved, and re-run.

For example, a block of code could be inserted into a drawing to be executed automatically by the program. Metadata Autodesk releases three types of metadata for its AutoCAD products, static, runtime, and dynamic. Static metadata is used to store information that is independent of a user's current session. Dynamic metadata is used to store information such as options, options that control the appearance of objects on the screen. Runtime metadata is used to store information that depends on a user's current session such as the preferences of an object, or a way to access objects. The static metadata is stored in a separate file that is placed next to the AutoCAD executable. This file is referred to as a "Metadata file" or "Metafile" in Autodesk terminology. The runtime metadata is saved and loaded into memory during the session, and is referred to as "Session data". It is usually implemented in a separate file, but it may be stored in a binary format in the same Metadata file as the static metadata. The dynamic metadata is often implemented in the runtime data and is used to control AutoCAD's appearance and the way it operates.

The metadata is available in the AutoCAD and Civil 3D products. In the earlier products, Dynamic metadata was named "Catalog metadata" while the Runtime metadata was called "Local metadata". In the earlier products, the Local metadata and Catalog metadata had the same name, Local. With the release of Civil 3D 2011, the two types were renamed to be consistent with Autodesk naming convention. Data types Autodesk metadata uses the following data types to store metadata. TypeDefs is used to define new types and add new properties to existing types. Structure is used to store the data of a specific type, such

as a drawing, layer, block, or template. ValueRangeDefs is used to define the list of the values that a structure may contain. PropertyDefs contains information about the properties of a type. Examples of metadata Some of the types and properties stored as metadata are given below. Properties The following list of properties are available in the metadata: BoundingBox DrawColorMap Export ca3bfb1094

Q: How to split a string, removing the brackets as well I have a text: somedata(somevalue1, somevalue2, somevalue3, [and_so_on]) I want it to split like this: somedata somevalue1, somevalue2, somevalue3, [and_so_on] The number of [and] is always the same, how can i achieve this? Thanks for the help! A: You can use a simple regular expression with a preg_split: \$string ='somedata(somevalue1, somevalue2, somevalue3, [and_so_on])'; \$arr = preg_split('\^\((\w+),(\w+),(\w+),\[(.+)\]\'', \$string); Demo The invention relates to a method for adjusting a template in a coordinate measuring machine. In a coordinate measuring machine (CMM) the surface of an object under measurement is detected by a sensor system. In order to be able to determine the position of a measured point in relation to the object under measurement, the coordinate system is fixed to the object under measurement. The position of a measured point in the coordinate system is determined by a measuring probe which is mounted on the CMM. For this, the probe is moved along at least one coordinate axis by the CMM. In the case of a hybrid CMM, the sensing units of the CMM are mounted on a mobile element of the machine and can be moved along the coordinate axes of the measuring probe. In order to be able to accurately determine the position of a measured point in the coordinate system, the probe must be guided in a parallel manner to the surface of the object under measurement. To this end, a template is moved along the measuring axis of the probe. The template contains reference points. By measuring the position of the template reference points in relation
