Compact designs are particularly desirable for portable devices such as mobile phones, portable computers and personal digital assistants. Such devices must operate on limited power. Such devices often use rechargeable batteries that provide only a limited amount of operating time. While compactness is often desirable in such devices, power consumption must be minimized in order to maximize the operating time. Compact amplifiers are often fabricated on the same integrated circuit as other types of circuits. For example, a power amplifier may be combined with an audio amplifier on the same integrated circuit. Because the power amplifier is often used to amplify low level signals, the power amplifier often consumes more power than the other integrated circuits. The power amplifier must therefore be designed to minimize power consumption. One design feature that affects power consumption is the output power versus input power characteristic. Power consumption is typically a nonlinear function of the output power. As the power level is reduced, the power consumption usually decreases to a minimum. The minimum power consumption must therefore be large enough to ensure that the devices will function properly with a minimum amount of power. The output power versus input power characteristic must also be sufficiently linear for the devices to operate properly. Linearity of this characteristic means that the amplifier will output a constant output power as a constant input power is applied. When the amplifier is used to amplify a signal of varying strength, the output power is proportional to the input power. This relationship is referred to as linearity. A lack of linearity in the output power can lead to degraded performance of the amplifier, particularly if the amplifier is used to amplify a signal of varying strength. As the power level is increased, the
