
Cage Birds Script Download Pdf [2021]

the poet uses personification in the last stanza, and this adds to the refiguring. the bird represents the poet, and the poet represents the bird. the bird's freedom and eyes are the poet's freedom and eyes, and the poet's awareness of the cage originates from the bird's view of his or her surroundings. in addition, we found that the superpathway of vitamin b6 metabolism (ko00430) was significantly upregulated in female magpies. this implies that female magpies might have a higher requirement for vitamin b6 than male birds, which would be beneficial to them due to their higher susceptibility to stress. the vitamin b6 superpathway includes four reactions, including those catalyzed by aspartate aminotransferase (aat; ec 2.6.1.1), arylamine n-acetyltransferase (ec 2.3.5), arylacetamide n-acetyltransferase (ec 2.1), and cysteine sulfinic acid decarboxylase (ec 4.29).

aspartate aminotransferase catalyzes transamination of aspartate and α -ketoglutarate to yield oxaloacetate and glutamate, which is the first irreversible reaction of the vitamin b6 superpathway. arylamine n-acetyltransferase and arylacetamide n-acetyltransferase are the key enzymes of the vitamin b6 superpathway, and they convert arylamine or arylacetamide into arylamine or arylacetamide n-acetyltransferase, respectively. cysteine sulfinic acid decarboxylase catalyzes the decarboxylation of cysteine sulfinic acid into cysteine, thus completing the conversion of cysteine and glutamic acid into cysteine sulfinic acid (fig. 5 a). we found that both the vitamin b6 superpathway and the urea cycle (ko00480) were downregulated in male magpies. the downregulation of the urea cycle would lead to decreased production

of urea and increased production of ammonia, which might be harmful to the male birds. In contrast, the downregulation of the vitamin B6 superpathway would result in decreased production of ammonia, which could lead to the accumulation of other amino acids and organic acids in the male birds. This would be beneficial for the male birds because they could then use these metabolites to produce energy or other substances to promote growth (fig. 5 a). In addition, the downregulation of the urea cycle in the male birds may increase glutamine synthesis and decrease glutamine catabolism, thus enhancing ammonia production and toxicity. The downregulation of the urea cycle also affects the nitrogen and carbon metabolic process (ko01100), the carbon metabolic process (ko00710), and the nitrogen metabolic process (ko00910) in the male birds (fig.
