sound waves are vibrations in the air. they can be transmitted by air or through solid objects. these waves can be created by the movement of air, such as a truck or helicopter, or by the contact of a solid object. sound waves travel in various ways, as well. sound can travel through water and air. it can travel in a liquid or gas, such as a liquid or a gas mixture. the distance sound can travel through a liquid is called the "speed of sound" or "viscosity." sound waves are reflected, refracted, and diffracted by objects. a sound wave can be reflected by a hard surface like a table or a wall. your job title or the name of your place of employment may not be as relevant as how you actually deliver services to clients. for example, a physical therapist may wear a lab coat and hold herself out as a doctor of physical therapy, even though she's not a medical doctor and does not practice medicine. if the designation of your employer is not clearly identified as such, that may pose a problem. sound cannot be measured directly. the method used to measure sound is called a sound meter. sound meters work on the principle of measuring the amount of sound pressure to which an object is exposed. a sound meter is a device used to measure the amount of sound pressure in a particular area. sound meters are available in three different forms: hand-held, wall-mounted, and floor-mounted. sound meters are more accurate when the sound pressure is measured from a point in space. this is done by placing the sound meter where the sound will be coming from. if the sound is coming from a hard surface, the sound meter will be placed on that surface, not on the body of the person. 5ec8ef588b
