# Wifi Auto Connect Software For Pc [VERIFIED]

Connecting your device to your smartphone using Bluetooth connection will also help if you cant get the device to work. Users of Windows with the Bluetooth stack version 4.0 will have more success than those with Windows 7, 8, or 10. It would also be wise to try connecting your device to different computers on the same network or to other computers in the same room. If the problem persists, try connecting your device to a different smartphone. This often fixes the issue. So, what other possible causes can result in this "WiFi disconnect" issue? There are ways you can check and troubleshoot your router's settings to be sure they arent causing the problem. Open the Chrome browser and visit the following websites and follow the instructions found within to make sure you have the correct settings: This website shows you in detail your router's configuration options. However, you may also want to explore our router troubleshooting guide to help troubleshoot other possible connection issues. Once Windows 10 is updated the WiFi Assist does not seem to be working properly. Some users on Reddit have had success in updating the Intel software via the smartphone app and then rebooting the PC. However, that has not worked for me. If the WiFi was still connected as the router has just booted you might have set the gateway to a local address (192.168.1.1 for example) but it will have changed since then. Double check that the router is still broadcasting its default gateway on wireless networks. First, make sure that your iPhone is updated to the latest version of the iOS software. Update all of the software on your iPhone and iPad to the latest available version. You can download and install iOS updates via the iOS App Store.
