A structural engineer modeling building standards properties and validating them using Tekla Structures should have no problem performing the most complex of tasks -- the steps are familiar, and the quality of the results is unmistakably Tekla. Only when the engineer reaches the details of the assembly, it becomes evident that these tasks present a different kind of challenge. Closure, as a special Tekla feature, can help here, but it can be clumsy to work with. This situation calls for a different approach. It requires an innovative method, on the one hand, and a feature, on the other, that have both simply never existed before in Tekla. Today's single structure designers must work with Tekla to model the structure. To address these complex modeling challenges, in the not-too-distant future, building designers will be able to design a large number of interconnected structures in Tekla structural engineer in multiple contexts, such as architectural, fire, earthquake, wind and other programmable contexts. Hence the key questions of "How should these structures connect to one another?" and "How should these structures scale to large numbers?" will provide essential building blocks for the era of mobile, micro, and infrastructural design. Tekla is the market-leading structural analysis and design software for the construction industry. Tekla is a comprehensive, 3D-structural analysis and design solution that enables you to model, analyze, and optimize buildings, structures, and bridges. 5ec8ef588b
