Visual Table Analyzer is a data analysis solution for business users. It offers you many reporting and analytical functions to discover patterns and relationships in your data. The latest release of the product, Visual Table Analyzer, introduces an advanced visualisation technology called "FanLens", which brings a novel visualisation approach to the product. "FanLens" is a technology that explores the data distribution by clustering using fan diagrams to reveal patterns and relationships in your data. How does FanLens work? Data is represented by a cluster of fan diagrams that are coloured differently and arranged in a circular fashion. Data categories are defined with a title and additional category details. In addition, the data set is given a tree-based layout. If you have a table with a certain amount of data and you want to see what the distribution of that data is, you can now use FanLens to easily interact with the data. FanLens uses a flexible data manipulation mechanism, to define the data categories in your data. By visualizing the data distribution in a tree-based layout, you can see the interrelationships of the categories in the data set. Visual Table Analyzer also offers you a flexible means of data manipulation, in order to build your own data categories to help you build an understanding of your data. What can you do with Visual Table Analyzer? Discover your data From the very first moment you start using Visual Table Analyzer, you will see that the tool is very intuitive. Start Visual Table Analyzer and choose your data source. Visual Table Analyzer will ask you to define a data set and a schema. Define a data set for any file you want to analyse, such as a sales report or a profit and loss statement. Once you have your data set defined, you can choose a schema. Choose a schema that will help you analyse the data you have. To understand your data, you can use different features such as: -filter to quickly display only the relevant data in your file -find to display details in your data file -explore to explore your data -filter and find to quickly analyse your data. Build your data categories FanLens is an innovative data analysis technology that uses a circle of fan diagrams to explore your data. Create a data category to represent any attribute in your data. When you add an attribute to your data, fanLens will create a fan diagram for that data. Choose a legend to display your data

+ An interactive and intuitive data exploration and analysis tool for quickly accessing and analyzing data sets + The ability to export data into a wide variety of file formats, including spreadsheets and diagrams + Easy-to-use data tables editor and query builder + Flexible data schema definition and validation system for custom tables and columns + Extensible by user extensions that make tables more valuable + Visualize data distribution and relationships with FanLens + Table annotations allow users to add their own information to the data tables COMPATIBILITY IBM Visual Table Analyzer has been tested on all major operating systems including: IBM z/OS IBM AIX IBM Linux IBM Tru64 Unix Sun Solaris RedHat Linux Windows 2000, Windows XP and Windows 2003. IBM Visual Table Analyzer uses the following applications: Microsoft Excel, Windows Calculator, Windows Notepad, and Microsoft Word To test this version of IBM Visual Table Analyzer, I loaded a large database of data on the following table: I then selected this table and right clicked on the "Analyze" button and chose "Analyze to Spreadsheet". I created a new spreadsheet and copied and pasted the data in the table in a row. Then I closed the spreadsheet and opened it back up and repeated the same steps again. I repeated this process until all the columns in the original table were copied. When I looked at the spreadsheet, the columns from the table were copied into rows and were left with the data. However, the first two rows were copied as one column instead of two. The spreadsheet could not handle the amount of data in the table. When I dragged the rows to the second row, a dialog appeared warning me that the spreadsheet could not handle the amount of data in the table. So I closed the spreadsheet and opened it back up. I then opened up the data again and right clicked on the data and selected "Analyze to Table" and I repeated the process again. The rows were separated and the spreadsheet could handle the data. To test the output of the spreadsheet, I selected each column and right clicked on each column header and chose the "Save Column" option and saved them all into a new folder. I opened up each folder individually and saved them into an html file. I then opened each of these html files and clicked on the "View As Table" button. I was able to see each of the cells in a single table format 2edc1e01e8

Softrobots are really, really hard to make. They have internal structure, hence, are not 'flying robots' in the sense of a simple bird-like flying toy. Softrobots were first made a few decades ago. The motorized part was made in about 1950 and the soft part in about 1960. However, there has been little effort made for some time to combine them together. The roboticists are still arguing over which direction to go in. One group thinks of making a soft robot which can crawl through soil and pick up material. This is a major issue, since soft materials like soil and mucus get sucked into the motors. The second group believes that this will not be necessary – that with their new method of fabrication, they will be able to make robots that can walk in water, even dig through the mud. [Thanks, Robert] Let's take a look at the progress of the field from what we have learned in the last decade or so. Structural Concepts Now, we know that soft robots tend to be quite unstable. So you need to make a frame that is strong enough to support the soft body parts and also provide the rigidity needed to stabilize it. The force and flexibility balance of the whole thing is critical. In the videos below, the inventor's goal was to create a lightweight version of an insect. The following videos show how an insect body can be constructed using a number of techniques. One of the designs is based on wax moth pupae. Starting with simple 3D
