It is provided for informational purposes only. Please do your own research before purchasing. If you like this product, please feel free to rate it. Thanks!Q: How to determine if a variable is initialized by a constructor or a setter? In C++11/14, is it possible to determine if a variable is initialized by a constructor or a setter? class A { int m_ ; public: A(): m_(1) { } void setM(int m) { this->m_ = m; } }; A foo; // initializes m_ by the default constructor foo.setM(2); // initializes m_ by the setter A: Without knowing more about your particular situation, and how you intend to use the class, there's no way to determine if the member variable was initialized by a constructor or setter. The member initializer list for a class, in which all the member variables are initialized by the body of the constructor, looks like this
