Using the app to edit is probably one of Photoshop's most important and most used features, so while visual quality and performance are par for the course, performance itself isn't something I'd expect to be anything out of the ordinary. Sure, there was a rough patch a few releases ago (including the big shift to the new workflow, the pixellated text, the newer-format conversion, and the loss of the batch processing, etc), but the app has been consistently great since then. If you are looking for a tiny app however, it's bound to disappoint you. To me the question is not about how it performs per se but on the role it plays with other applications. A tool like LR is not supposed to produce the final version of your image, it is supposed to help you. All editing commands already have undo and redo options plus most of them have presets. This is how a workflow is supposed to be - but they are just words without action. However, in Photoshop the produced result (the final output) must be exactly what you see on the screen. That's why the tool is made the way it is. However, it's also the biggest shame - it is not easy to customize or make it a real workflow tool - unless you switch to a tool like Lightroom. You can't really be a Photoshop fan without knowing that Adobe is now extending its image-editing software to almost every major operating system, including macOS and iOS. And not just Apple computers—and even Windows PCs. But screenshots are always best. So here they are, from the Apple Mac version of Adobe Photoshop.)
