I am a professional photographer, and I use Lightroom to edit my photos and then process them in Photoshop. Lightroom is too easy to use, which is the reason I prefer it, as well as the fact that it is faster than Photoshop. The new features will only make it faster, and the quality is fantastic. I use Lightroom all the time, and it has saved me countless hours. When I first started using Lightroom I thought it would take me a while to learn it, and with only a few things it was amazing. But I started using it more and more and learned new things. Anyway the new feature in Lightroom 5.0 is the ability to access and rotate materials that are nested in a record. For example, a finalized high dynamic range image in Lightroom 5.0 will allow you to view and transform the high dynamic range material. Either you can view the adjustment layer and tweak the images directly or you can use the new layer style "access" to see the high dynamic range image and change it as you can. In my opinion, to make a style access, you should be able to rotate their material as well. Well I wonder if anyone out there tried to do this and if they noticed any problems. I want to elaborate in depth on some of the features of Photoshop, as they are needed for a more comprehensive review. I love the new feature of light editing in the past, but in my opinion if Lightroom works for you and it is fast and easy enough to use then you should not even need Photoshop. In the past, I have been diligent in using Photoshop with the intention of further developing my skills. While I have learned so much that I don't need to use Photoshop as my primary editing tool, there are still a number of things that require some hands-on experience.

reasons, such as the high image quality and its powerful tools, such as retouching, filters and retro photo enhancements, among others. Photoshop is a professional image editing software that can be used to fine-tune and create digital images. Photoshop CC 2014 includes lots of new features geared at improving image mashups, fixing problems, and giving you more creative control. Photoshop is the preeminent tool for producing web-ready CSS layouts, and for creating fully functional websites with interactive elements such as splash pages, slider previews, and contact forms. A web designer should know Photoshop if they intend to design their own websites. After working with the Elements suite for several years, it's clear that Photoshop products on the web are the most advanced web-ready CSS layouts out there. Photoshop is the industry-leading tool for creating interactive design assets. And while Elements is the closest Adobe comes to these tools, it doesn't compare to Photoshop. There have been some features added to Elements (such as crop and rotate options and the ability to edit linked files), but these are light years away from the full set of Photoshop's editing tools. Photoshop is Adobe's flagship consumer app and is currently one of the most popular graphics editor apps in use. The company has been planning to remove the desktop element from its product lineup for years, and traditionally has found this more profitable for them. This is somewhat different given how much of an open web crowd it can now expect to need to associate Photoshop with the internet. However, it is Adobe's view that web-ready CSS layouts and responsive design will be far more important to consumers in 2015 then corporate custom design. Adobe has encountered competitors developing apps that rival Photoshop over the past years, and their own products like Photoshop below mentioned.
