Cheers! Induction of herpes simplex virus latency by an interferon-gamma-treated fibroblast line. Certain cell types support viral replication, but not lytic viral replication. Latent infection without lytic replication of herpes simplex virus (HSV) may occur in response to interactions with network cells of immune privilege. Networks of fibroblasts support lytic infection of HSV, but no data exist regarding the ability of fibroblasts to support establishment of latency, even though fibroblasts can mount intrinsic and acquired immune responses against HSV in vivo. We now demonstrate that established L4SV fibroblasts induced permissiveness to HSV-2 at the level of isolation permissivity (an immunosuppressive state) in the presence of interferon-gamma (IFN-gamma) or TNF-alpha, concanavalin A, or endotoxin. Virus production was significantly reduced during the latent period. The presence of IFN-gamma induced a cellular environment permissive for the development of certain cytotoxic inflammatory responses to HSV, and the virus-induced production:interferon-gamma ratio was elevated in the same cell type that supported latency.
